24/7 365 CONSTANT MONITORING

CONSTANT MONITORING OF CO2 & CLEAN AGENT FIXED FIRE SUPPRESSION SYSTEMS

To ensure your fire systems are ready to protect you, your personnel, assets and infrastructure at all times, use Permalevel Multiplex. This fixed ultrasonic liquid level monitoring system constantly checks cylinder content. It will immediately trigger an alert in the event of any agent discharge or seepage. With very flexible alarm capabilities. It can be easily integrated using 4-20mA, RS232, RS485, Amerex Integrated, and other pathways, for SMS and email alert, regular reporting, data logging and management.

ROOM INTEGRITY MONITORING

Checking the protected space is vital, but often overlooked. Ensuring the integrity of the room into which the suppressant gas will discharge is critical. This determines agent hang time in the room - essential for suppressing the fire. If there are significant leaks, it may not. Commonly, room integrity is not done after point of installation despite the building changing. Utilising ultrasonic technology enhances pre-survey inspections, quickly and easily - giving an indication of any issues which can be followed up by pressure/door fan testing.
